# Question 11.9

For a path defined by C: $\vec{\boldsymbol{r}}(\boldsymbol{s})$, which one of the following statements is not true?

a. The parameter “s” always increases in the direction of increasing “t”
b. The path $\vec{r}(s)$ determines where we are on a curve after a time “t”
c. The unit vector $\hat{T}$ is the rate of change of $\vec{r}(s)$ with respect to “s”
d. The rate at which $\hat{T}$ turns per unit length along a curve defines the curve’s curvature
