

2.0 Roots of Equations

- Recall from last day, solving roots of equations:
 - 1) Graphical methods – works, but can be inaccurate
 - 2) Special cases
 - a) Quadratic formula
 - b) Plotting intersection if equation is a linear combination of at least 2 functions
 - 3) Bisection (Bracketing) method – requires 2 initial guesses that bracket the root [iterative method, will converge, but can be slow]
 - 4) Open methods – requires 1 or 2 starting values, but not required to bracket the root [iterative methods, can diverge]
